

# THERE'S A WORLD OF POSSIBILITIES BEYOND CROHN'S DISEASE

## INTRODUCING THE YELLOWSTONE CROHN'S DISEASE CLINICAL RESEARCH PROGRAM

The YELLOWSTONE Program is a series of clinical research studies evaluating the safety and effectiveness of an oral (taken by mouth) investigational study drug called ozanimod for adults living with moderately to severely active Crohn's disease (CD). This investigational study drug is being evaluated for reduction of symptoms and overall disease by targeting the immune system.

If you are currently experiencing active symptoms of CD, please ask a study team member for more information about the YELLOWSTONE Program. [www.crohnsstudies.com](http://www.crohnsstudies.com)
